

Former Students' Examples of Infographic

Happiness and Self-Esteem Among PSY100 Students

657 Students, **472** Females, and **187** Males

were asked about their overall well-being in terms of happiness and self-esteem. This infographic highlights the distribution of their scores, explores the connection between happiness and self-esteem, and provides key insights into their emotional and mental health.

50% of Students' happiness scores are higher than the average

There is an equal feeling of a low level of happiness and high level of happiness among the population.

50% of Students' self-esteem scores are higher than the average

There is an equal feeling of a low level of self-esteem and high level of self-esteem among the population.

Happiness and Self-Esteem Is Not Gendered

Both self-identifying male and female students report similar happiness and self-esteem scores. Consistent patterns can be observed across both groups, and the population in general.

Female Averages

22 Happiness
17 Self-Esteem

Male Averages

22 Happiness
19 Self-Esteem

Greater Self-Esteem Results In Greater Happiness

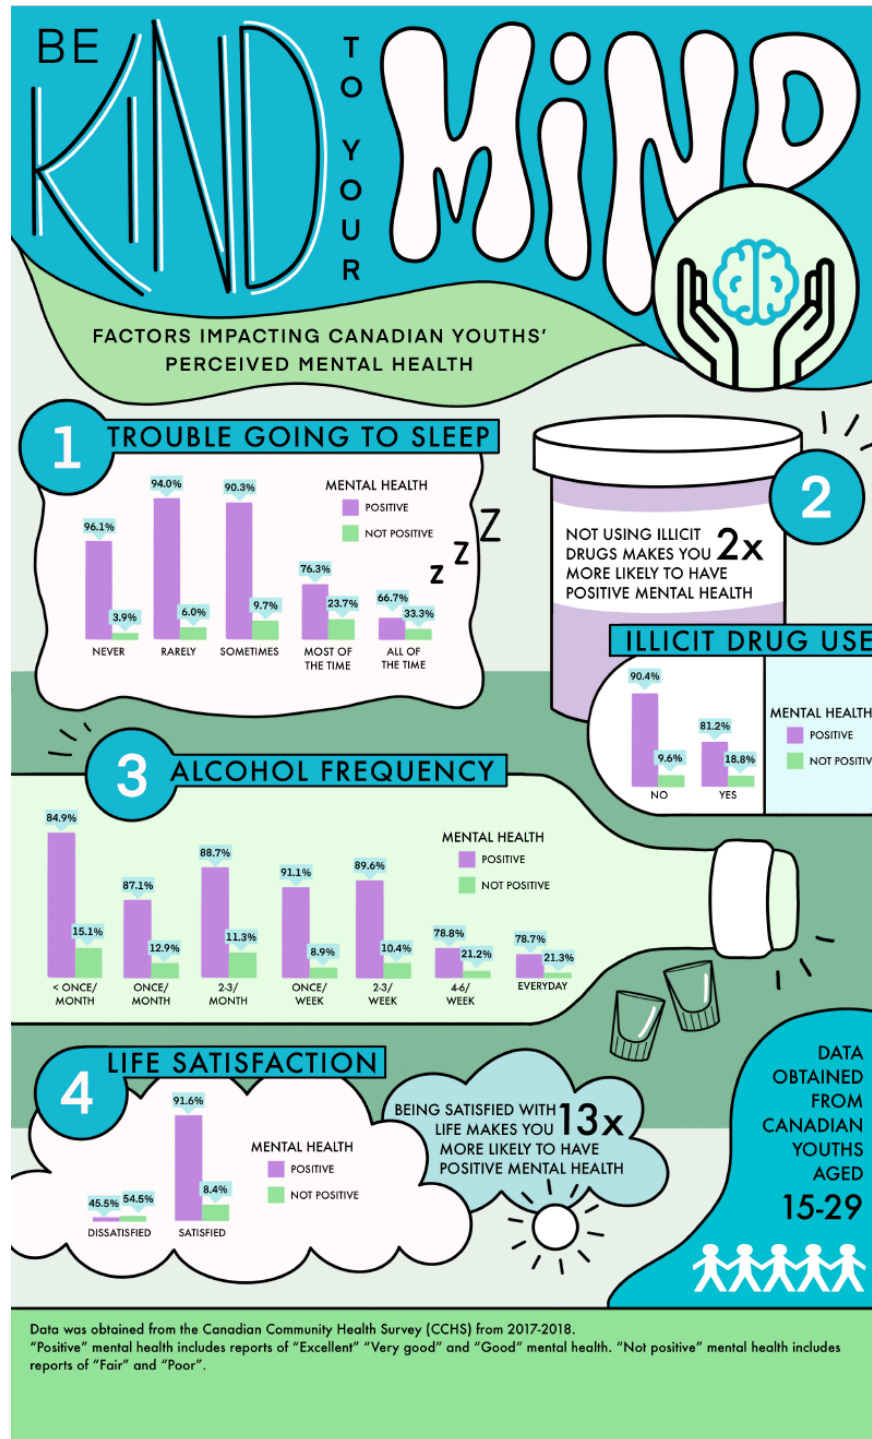

This reveals a **positive trend**, students with higher self-esteem tend to report greater happiness. This connection highlights the powerful role self-esteem plays in fostering a happier outlook

Happiness and self-esteem are positively connected, reinforcing each other. Students with higher happiness often experience higher self-esteem, underscoring the importance of fostering both for overall well-being.

What's Influencing Youth Mental Health in Canada?

An Analysis on Alcohol & Drug Use, Life Satisfaction, & Social Activity Engagement

PERCEIVED MENTAL HEALTH

Between 2017-2018 over 4,500 individuals aged 15-29 completed the CCHS assessing their perception of mental health alongside additional life variables

Key Factors found to have contributed to negative self-perceptions of mental health:

- Alcohol & Drug Use
- One's engagement with social activity
- One's satisfaction with their life

Someone who drinks alcohol 4+ times a week is **2x More likely** to have negatively perceived mental health than someone who drinks 3x a week or less

while

Individuals who admitted to using illicit drugs were **2.17x More likely** to have negatively perceived mental health than individuals who do not

Individuals who enjoy social activity are **4.18x** more likely to have a positively perceived mental health than an individual who doesn't

REPORTING POSITIVE V.S. NEGATIVE MENTAL HEALTH

Individuals who are satisfied with their life are

13.15x

more likely to have a positive perception of their own mental health

Education, Income, & Health Expectancy

Disparity of health expectancy in Canada is increasing

Statistics Canada has found that between 1996 and 2011 disparity in Health Expectancy, amount of years spent in good health, have increased across Education and Income levels

Absolute Change over time

Across all levels of education or income all Health Expectancy has increased

Education within Income disparities

% of life spend in good health

Those with the highest education and income can live up to 16% more of their life in good health when compared to the lowest in education and income

Changes in Disparities over time

The benefit of increased healthcare quality disproportionately gone to high educated + high-income individuals. The health expectancy difference between the two groups has grown by 3 years since 1996

DATA

LIFE SATISFACTION

A Nominal War

The purpose of this study is to gather various information about OECD countries and partners in order to promote policies that aims to improve the economic and social well-being of people around the world so lets not make this about males and females.

With every additional 1 life satisfaction score increase in females, the male life satisfaction score is estimated to increase by 0.87, on average.

Women - 1, Men - 2

Life Satisfaction_Male - $0.16167357 + 0.96895293$ Life Satisfaction_Female

The differences boxplot is more useful for learning about gender differences in the participating OECD countries.

The distribution of scores in life satisfaction among both females and males are skewed left.

About 50% of the females in the OECD countries have life satisfaction scores between 6 and 7.35. While 50% of males in the OECD countries have life satisfaction scores between 5.95 and 7.2.

SD

"Somewhat unusual threshold"

Q: Are you somewhat unusual?

0.32

A: I'll leave it up to determine what's mean. After all its all about being "normal"

PERCEIVED SOCIAL NETWORK SUPPORT

A comparison between males and females respondents based on data collected in 2018 from 36 OECD countries

"If you were in trouble, do you have relatives or friends you can count on to help you whenever you need them, or not?"

Here's how the randomly selected males and females aged 15 years and older responded:

FEMALES

MALES

About 91% of females and 90% of males believe that they know someone they could rely on in time of need.

With the median perceived social support percentage for the females being slightly higher (91.50%) than males (91%), it is safe to state that 50% of the OECD countries have a perceived social support percentage between about 91% and 98% for males and females

Is there a difference between the population mean perceived social network percentage between males and females?

Hypotheses:

$H_0: \mu_d = 0$ The null hypothesis is that there is no difference between the true female and male perceived social network support percentage

$H_a: \mu_d \neq 0$ The alternative hypothesis is that there is a difference between the true female and male perceived social network support percentage

T statistic

P-value

Reject null

we can conclude that a difference exists between the population mean female and male perceived social network percentage.

95% Confidence Interval
[0.1918, 1.748]

We are 95% confident that the true population mean difference of perceived social network support percentage between males and females is between 0.19 and 1.75.

Source: <https://stats.shinyapps.io/inference.mean/>

DO YOU HAVE FRIENDS OR RELATIVES THAT YOU CAN RELY ON IF YOU'RE EVER IN TROUBLE?

89%

OF PEOPLE STATED THAT THEY KNOW SOMEONE THEY COULD RELY ON IN TIME OF NEED, ACROSS 36 OECD COUNTRIES.

90% OF WOMEN BELIEVE THEY HAVE THIS KIND OF SOCIAL SUPPORT IN COMPARISON TO 88% FOR MEN.

THE OECD ANALYZED AND COLLECTED DATA FOR "BETTER LIFE INDEX" (BLI), WHICH WAS PUBLISHED IN 2019 BUT COLLECTED IN 2018 UNDER QUANTITATIVE VARIABLE "SOCIAL NETWORK SUPPORT". VARIABLES OF INTEREST COLLECTED:

- PERCENTAGE OF PEOPLE (15 YEARS OF AGE AND OLDER) HAVING SOCIAL NETWORK SUPPORT FROM 36 OECD COUNTRIES IN 2018

- GENDER OF THE RESPONDENTS IDENTIFIED AS MALE, FEMALE

SOME OF THE ISSUES COUNTRIES AND SOCIETY CAN FACE WITH LOW SOCIAL NETWORK SUPPORT:

- LIMITED ECONOMIC OPPORTUNITIES
- A LACK OF CONTACT WITH OTHERS
- FEELINGS OF ISOLATION -> FAMILY BREAKDOWN, THE LOSS OF A JOB, ILLNESS OR FINANCIAL DIFFICULTIES

City of Statistics

Created by - Rui Xiang

-Yanzhen Liu

- Both the distributions of males and females percentages of perceived social network support are skewed left.
- The two distributions have similar centers.
- the median % of female social network support is 91.5%, the median % of male social network support is 91.0%.
- the mean % of female social network support is 94.67%, the mean % of male social network support is 89.67%.
- The two distributions have different spreads.
- The distribution of female % of social network support ranges from 90% to 98% with IQR of 6%.
- The distribution of male % of social network support ranges from 86% to 97% with IQR of 7.5%.

Side by Side Boxplot School

The boxplot of Support Network percentage by Sex

linear regression line:
 $\hat{y} = -9.645725 + 1.075677X$

The line tells us that the average of the % of males perceived social network support we would expect for a given % of females perceived social network support.

plots of residuals Park

Residuals on % Female Perceived Network

Scatterplot Bank

There appears to be a strong positive linear association between the % of males perceived social network support and the % of females perceived social network support. This means higher % of females perceived social network support are associated with higher % of males. As the % of females perceived social network support increases, the % of males perceived social network support tends to increase. There is no outlier.

Assumption of Normality East Tower
 It checks whether the residual points are approximately normally distributed. we can check by using histogram, boxplot, or a-q-plot.

Assumption of Equal Variance West Tower
 It checks whether residual points are evenly spread out around the zero line. In the plot, the residuals have constant variance.

Assumption of Linearity Apt.
 It checks whether residual points are randomly placed around the zero line. This plot meets this assumption.

R^2 Gas Station
 About 80.588% of the variance in the % of males perceived social network support is explained by the % of females perceived social network support.
 $R^2 = 0.80588$

Teen Moms and Poverty

By: Selvin Leenus
(1006617859)

Poverty has been seen as both a cause and consequence of teen pregnancy. In the majority of the states in the United States, teen mom rates have been recorded to be almost equal to the state's poverty rate.

Important Statistics

Poverty in America has a mean of 12.85 and standard deviation of 3.06 while the prevalence of teen moms has a mean of 10.36 and standard deviation of 2.52.

The three states with the highest poverty rates in increasing order are New Mexico, Mississippi, and Louisiana. They also have teen mom rates of 15.7, 13.7, and 17.1 respectively.

The minimum poverty rate is 7.6 at New Hampshire and the minimum teen mom rate is 6.4 at both Massachusetts and New Jersey.

Relating Teen Moms to Poverty

When looking at the incidence of teen moms and poverty in all of America, there is a correlation of 0.8454. This implies a strong positive linear correlation between the two variables, and that as poverty rates increase, the rate of teen moms also increases.

Least Squares Prediction Equation

An equation can be used to predict the teen mom rate based on the poverty rate. The y-intercept for this equation would be 1.39 and the slope of the line would be 0.70. The equation would thus be:

$$\text{Teen mom rate} = 1.39 + 0.70(\text{Poverty})$$

SOCIAL NETWORK SUPPORT

"If you were in trouble, do you have relatives or friends you can count on to help you whenever you need them, or not?"

The OECD Better Life Index aims to compare well-being across 36 countries using internationally comparable indicators of life satisfaction.

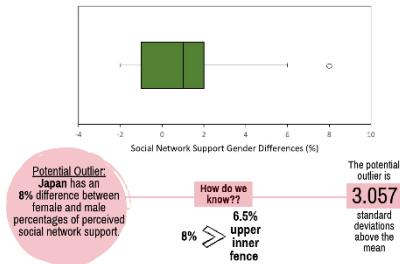

36
OECD
countries

The purpose of this study was to observe the social network support differences between males and females 15 years and older in 36 OECD countries.

Using microdata collected from the **Gallup World Poll**, perceived social network support is based on the proportion of male and females respondents that have relatives or friends that they can count on to help them in times of need and trouble.

Differences in Social Network Support

As the percentages of female's perceived social network support increases, the percentages of male's perceived social network tends to increase.

$$\hat{y} = -9.648925 + 1.095699x$$

The regression line tells us the average % of males perceived social network support at a given % of females perceived social network support

81%

of the variation in % of males who have network support is explained by the variation of the % of females who have network support

$r = 0.8977068$

indicates a strong positive straight-line correlation

STA220

Social Network Support in OECD Countries

By: Veronica Chiang | 1003957211

Male vs. Female? This study will compare and contrast the differences in percentages of perceived social network support of people aged 15 and over in various countries around the world.

IN CONCLUSION

of variance in the percentage of males' perceived social network support is explained by the linear relationship with the percentage of females' perceived social network support.

UNLOCKING KEY PREDICTORS OF POSITIVE PERCEPTION OF MENTAL HEALTH AMONG YOUTH
